Cell Biology

Structure and Function of Cells

Cells are the basic units of life, and understanding their structure and function is fundamental in biology. The syllabus distinguishes between two primary types of cells:

- Prokaryotic Cells: These are simple, small cells without a nucleus, e.g., bacteria. They have a cell membrane, cytoplasm, and genetic material in the form of a single circular DNA.
- Eukaryotic Cells: These are complex cells with a defined nucleus and membrane-bound organelles. Examples include plant and animal cells.

Key organelles in eukaryotic cells include:

- Nucleus: Controls cell activities and contains genetic material (DNA).
- Cytoplasm: The jelly-like substance where organelles are suspended.
- Cell Membrane: Regulates entry and exit of substances.
- Mitochondria: Powerhouses of the cell, responsible for energy production.
- Chloroplasts (in plant cells): Site of photosynthesis.
- Vacuoles: Storage organelles, large in plant cells.

Functions of these components are critical for maintaining life processes such as growth, reproduction, and response to stimuli.

Cell Division

Understanding how cells reproduce is vital. The two main types are:

- Mitosis: A process of cell division that results in two genetically identical daughter cells, essential for growth and repair.
- Meiosis: Reduces chromosome number by half, producing gametes (sperm and eggs), crucial

for sexual reproduction.

Classification of Living Organisms

Kingdoms of Life

The syllabus emphasizes the classification of organisms into five major kingdoms:

- Monera: Bacteria and blue-green algae.
